

INTRODUCTION TO SET THEORY

A.Charles, M Sc., PGDCA., MPhil(CS).,
Associate Professor in Computer Science,
St.Joseph's College (Autonomous),
Tiruchirappallai-620 002.

TOPICS

- Basic concepts of Set theory
- Types of Set
- Operations on Sets
- Laws of Set theory (Set Identities)

Basic Definition

- A collection of well defined objects is called a set and described with in braces($\{\}$).
- The uppercase English alphabets, with or without subscripts, are used to denote sets and lowercase English alphabets are used for denote objects of the set.
 - E.g. A set of all Alphabets $A = \{ a, b, c, \dots, z \}$
- Any object in the set is called **element** or **member** of the set.
- If x is an element of the set A , then we can read as “ x belongs to A ” or “ x is in A ”, and if x is not an element of X , then we can read as “ x does not belongs to A ”

Cont.....

- Typically sets are described by two methods

- ❖ Roster or list method:

- In this method, all the elements are listed in braces.

- E.g. $A = \{2, 3, 5, 7, 11, 13\}$

- ❖ Set-Builder method:

- In this method, elements are described by the property they satisfy.

- E.g. $A = \{x : x \text{ is a prime number less than } 15\}$

Cardinality

- The number of elements in the set A is called **cardinality** of the set A , denoted by $|A|$ or $n(A)$.
- We note that in any set the elements are distinct. The collection of sets is also a set.

$$\text{E.g. } S = \{2, \{3, 5\}, 7, 11, 13\}$$

- Here $\{3, 5\}$ itself one set and it is one element of S and $|S|=4$.

Types of Set

○ Universal set

- A set which contains all objects under consideration is called as Universal set and is denoted by E or U.
- E.g. For example, $U = \{0,1,2,3,4,5,6,7,8,9\}$ may be considered as a universal set when we consider sets $A = \{0,1,3,5\}$ and $B = \{1,4,7\}$

Cont.....

○ Finite or Infinite

- A set is called **finite** if it contains finite number of distinct elements; otherwise, a set is **infinite**.
 - E.g. $A = \{\text{Charles, Kumar, Mohan, Ravi}\}$ is a finite set
 - E.g. $B = \{1, 2, 3, 4, 5, \dots\}$ is an infinite set

Cont.....

○ Null Set

- A set contains no element is called a **null set**.
- It is also called an **empty set** or a **void set**, or a **zero set**.
- It is usually denoted by the $\Phi(\emptyset)$ or two empty braces ($\{ \}$).
- For example, the set of prime numbers between 8 and 10 is **null set**.

Cont.....

○ Subset

- A set A is said to be a **subset** of set B, if every element of A is also an element of B.
- It is denoted by ‘ \subseteq ’ $A \subseteq B$.
- E.g. $A = \{1, 2, 3, 4\}$ and $B = \{1, 2, 3, 4, 7, 8\}$ Then $A \subseteq B$.
- Note that
 1. A set is subset of itself.
 2. Null set is subset of every set.

Cont.....

○ Superset

- A set A is said to be a **superset** of set B, if B is a subset of A.
- It is denoted by $A \supseteq B$.
- E.g. $A = \{ 1, 2, 3, 4, 7, 8 \}$ and $B = \{ 1, 2, 3, 4 \}$ Then $A \supseteq B$.

Cont.....

○ Proper subset

- A set A is said to be a **proper subset** of B , if A is a subset of B and there is at least one element in B , which is not an element of A .
- E.g. $A = \{1, 2, 3, 4\}$ and $B = \{1, 2, 3, 4, 7, 8\}$
- Here A is a Proper Subset of B

Cont.....

○ Singleton Set

- A set contains only one element is called a **singleton set**.
- For example, the set of prime numbers between 24 and 30 is a singleton set, its Only element being 29.

Cont.....

○ Power set

○ A power set of a set A , denoted by $P(A)$, is set of all subsets of A .

- E.g. If $A = \{ 1, 2, 3 \}$, then, $P(A) = \{ \emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{1, 3\}, \{2, 3\}, \{1, 2, 3\} \}$.
- Note: If number of elements in A is n , then the number of elements in the power set of A is 2^n .
- We observe that $n(A) = 3$ and $n(P(A)) = 2^3 = 8$

Cont.....

○ Equal Sets

- Two sets A and B are said to be **equal** iff $A \subseteq B$ and $B \subseteq A$.

i.e., $A = B \Leftrightarrow (A \subseteq B) \wedge (B \subseteq A)$

- E.g. $A = \{1, 3, 5, 8\}$ and $B = \{1, 8, 5, 3\}$ Then $A = B$

Cont.....

○ Disjoint Set

○ Two set A and B are called **disjoint** if and only if ,A and B have no element in common.

○ Example

- $A = \{1, 2, 3\}$ $B = \{5, 7, 9\}$ $C = \{3, 4\}$

- $A \cap B = \emptyset$ $A \cap C = \emptyset$ $B \cap C = \emptyset$

- A and B are **disjoint** and B and C also, but A and C are **not disjoint**.

Cont.....

Complement of a set

- Let A be any set, and E be universal. The relative complement of A in E is called **absolute complement or complement of A** .
- The complement of A is denoted by A^C (or) \bar{A} (or) A'

Example

- Let $E = \{1, 2, 3, 4, 5, \dots\}$ be universal set and $A = \{2, 4, 6, 8, \dots\}$ be any set in E , then $\bar{A} = \{1, 3, 5, 7, \dots\}$

Operations on Sets

○ Union of two sets

- The union of two sets A and B is the set of all elements which belong to either A or B or both.
- It is denoted by $A \cup B$.
- Thus $A \cup B = \{x / x \in A \text{ or } x \in B\}$
- For example
 - if $A = \{1, 2, 3\}$ and $B = \{2, 4, 6\}$, then
$$A \cup B = \{1, 2, 3, 4, 6\}.$$

Cont.....

○ Intersection of two sets

- The intersection of two sets A and B is the set of all elements which belong to both A and B.
- it is denoted by $A \cap B$
- Thus $A \cap B = \{x / x \in A \text{ and } x \in B\}$
- For example, if $A = \{1, 2, 3\}$ and $B = \{2, 4, 6\}$ Then $A \cap B = \{2\}$

Cont.....

• Set Difference (Relative complement)

- The relative complement of a set A in a set B is the set of elements of B which are not the elements of A .
- It is denoted by $B - A$.
- Thus $B - A = \{x / x \in B \text{ and } x \notin A\}$.
- It is also called the **difference between B and A** .
- We observe that $A - B = \{x / x \in A \text{ and } x \notin B\}$
- Thus $A - B = B - A$ and in fact $(A - B) \cap (B - A) = \emptyset$.
- For example if $A = \{1, 2, 3\}$ and $B = \{2, 4, 6\}$ Then $B - A = \{4, 6\}$, while $A - B = \{1, 3\}$

Cont.....

- Symmetric difference

- The symmetric difference or Boolean sum of two sets A and B is the difference set between $A \cup B$ and $A \cap B$.

- It is denoted by $A + B$ (or) $A \oplus B$.

- Thus $A + B = (A \cup B) - (A \cap B) = \{x / x \in (A \cup B) \text{ and } x \notin (A \cap B)\} = (A - B) \cup (B - A)$

- Example

- If $A = \{1, 2, 3\}$ and $B = \{2, 4, 6\}$ Then $A \cup B = \{1, 2, 3, 4, 6\}$ and $A \cap B = \{2\}$ So that, $A + B = \{1, 3, 4, 6\}$

Cont.....

○ Cartesian product

- The Cartesian product of two sets A and B is the set of all ordered pairs (a, b) where $a \in A$ and $b \in B$.
- It is denoted by $A \times B$.
- Thus $A \times B = \{(a, b) / a \in A \text{ and } b \in B\}$
- Let $A = \{1, 2\}$ and $B = \{x, y, z\}$ then
- $A \times B = \{(1, x), (1, y), (1, z), (2, x), (2, y), (2, z)\}$
- $B \times A = \{(x, 1), (x, 2), (y, 1), (y, 2), (z, 1), (z, 2)\}$
- $A \times A = \{(1, 1), (1, 2), (2, 1), (2, 2)\}$
- $B \times B = \{(x, x), (x, y), (x, z), (y, x), (y, y), (y, z), (z, x), (z, y), (z, z)\}$

Set Identities

$$A \cup A = A$$

$$A \cap A = A$$

$$A \cup B = B \cup A$$

$$A \cap B = B \cap A$$

$$(A \cup B) \cup C = A \cup (B \cup C)$$

$$(A \cap B) \cap C = A \cap (B \cap C)$$

Idempotent laws

Commutative laws

Associative laws

Cont.....

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

Distributive laws

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

$$A \cup (A \cap B) = A$$

Absorption laws

$$A \cap (A \cup B) = A$$

$$\overline{(A \cup B)} = \bar{A} \cap \bar{B}$$

De Morgan's laws

$$\overline{(A \cap B)} = \bar{A} \cup \bar{B}$$

Cont.....

$$A \cup \emptyset = A$$

$$A \cap U = A$$

Identity Laws

$$A \cup \bar{A} = U$$

$$A \cap \bar{A} = \emptyset$$

Complement Laws

$$\bar{\bar{A}} = A$$

Double Complement Law
